# The Application

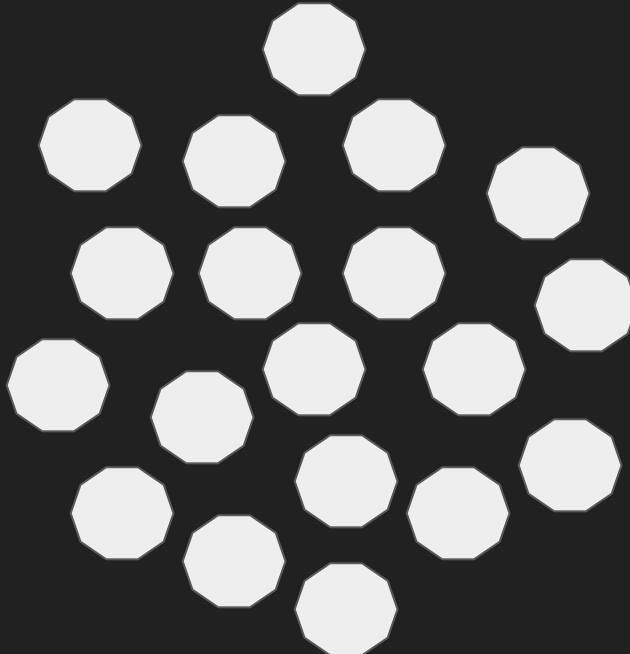

# Modules

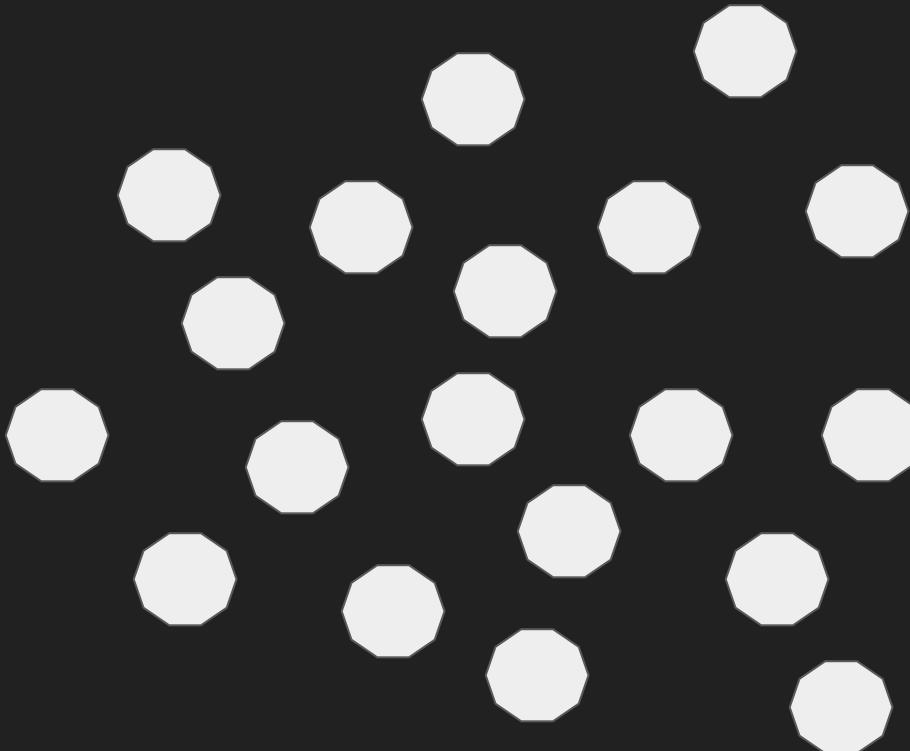

# Microservices

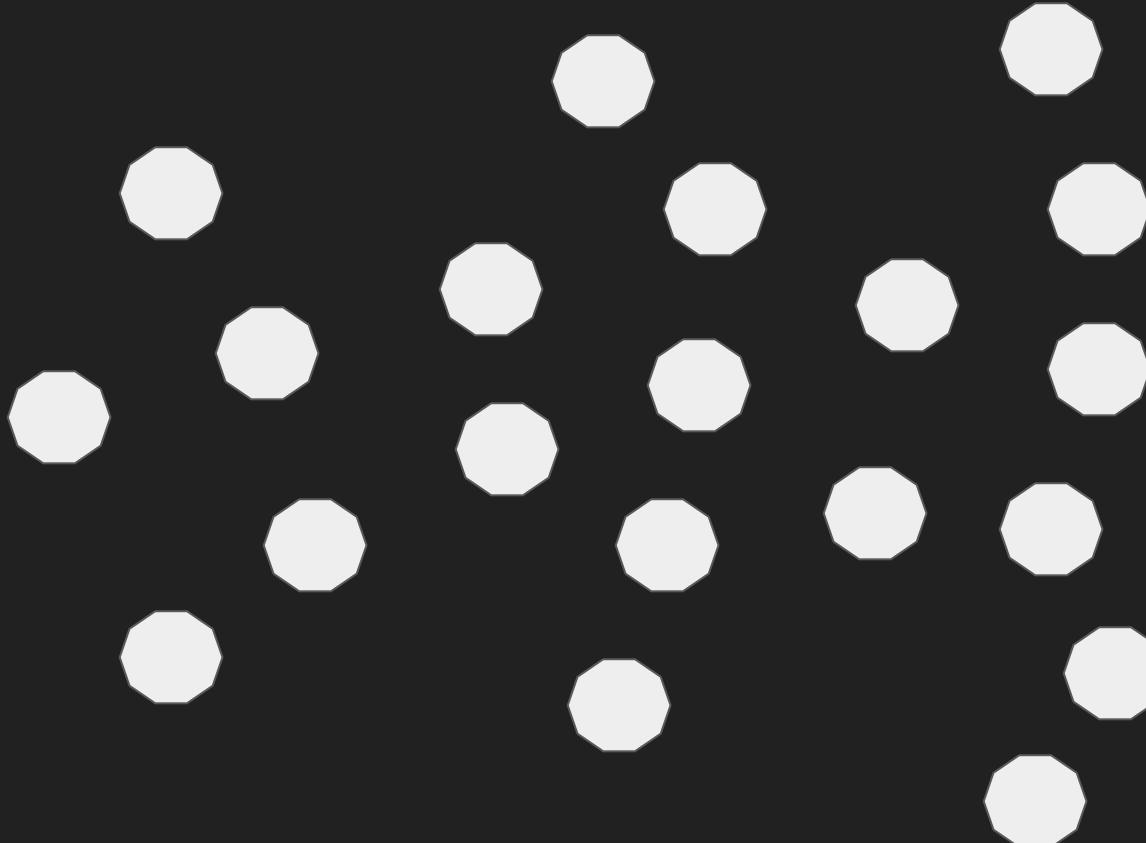

# Microservices

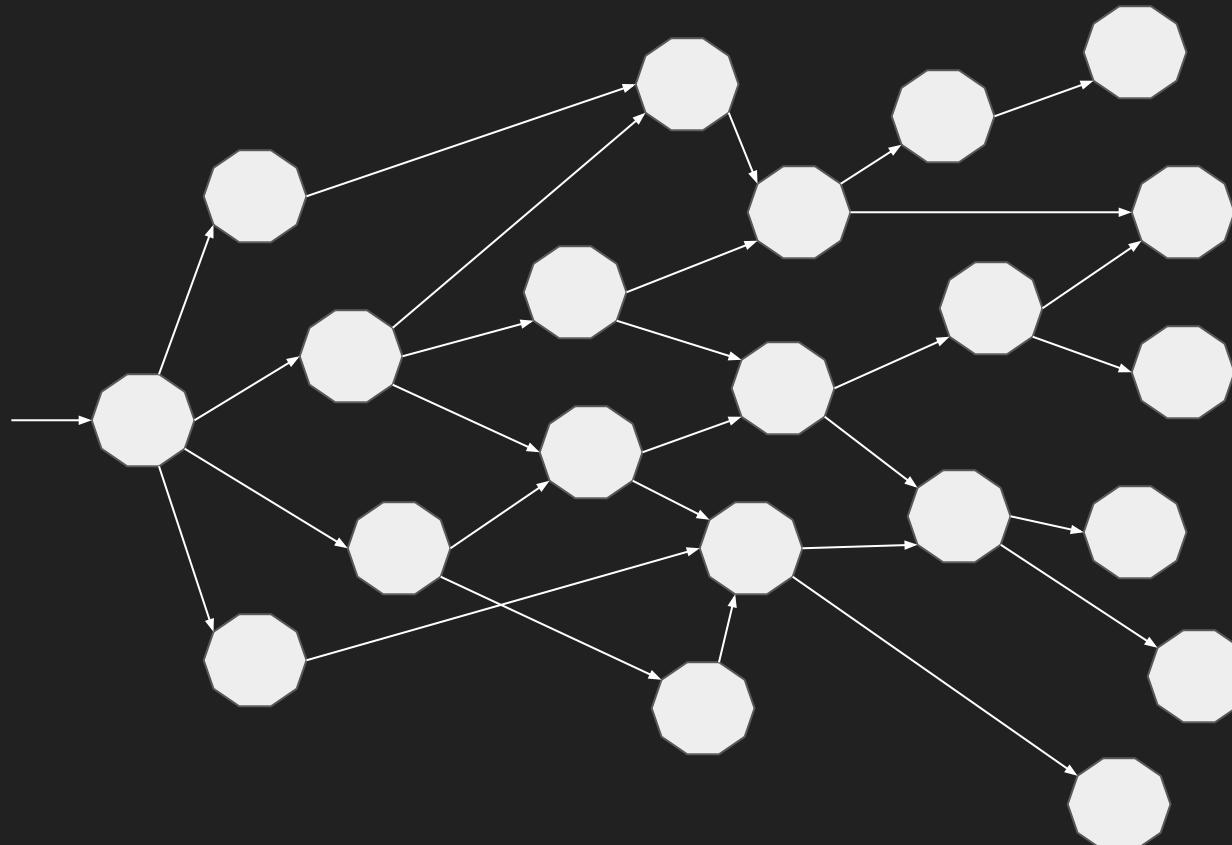

# Microservices

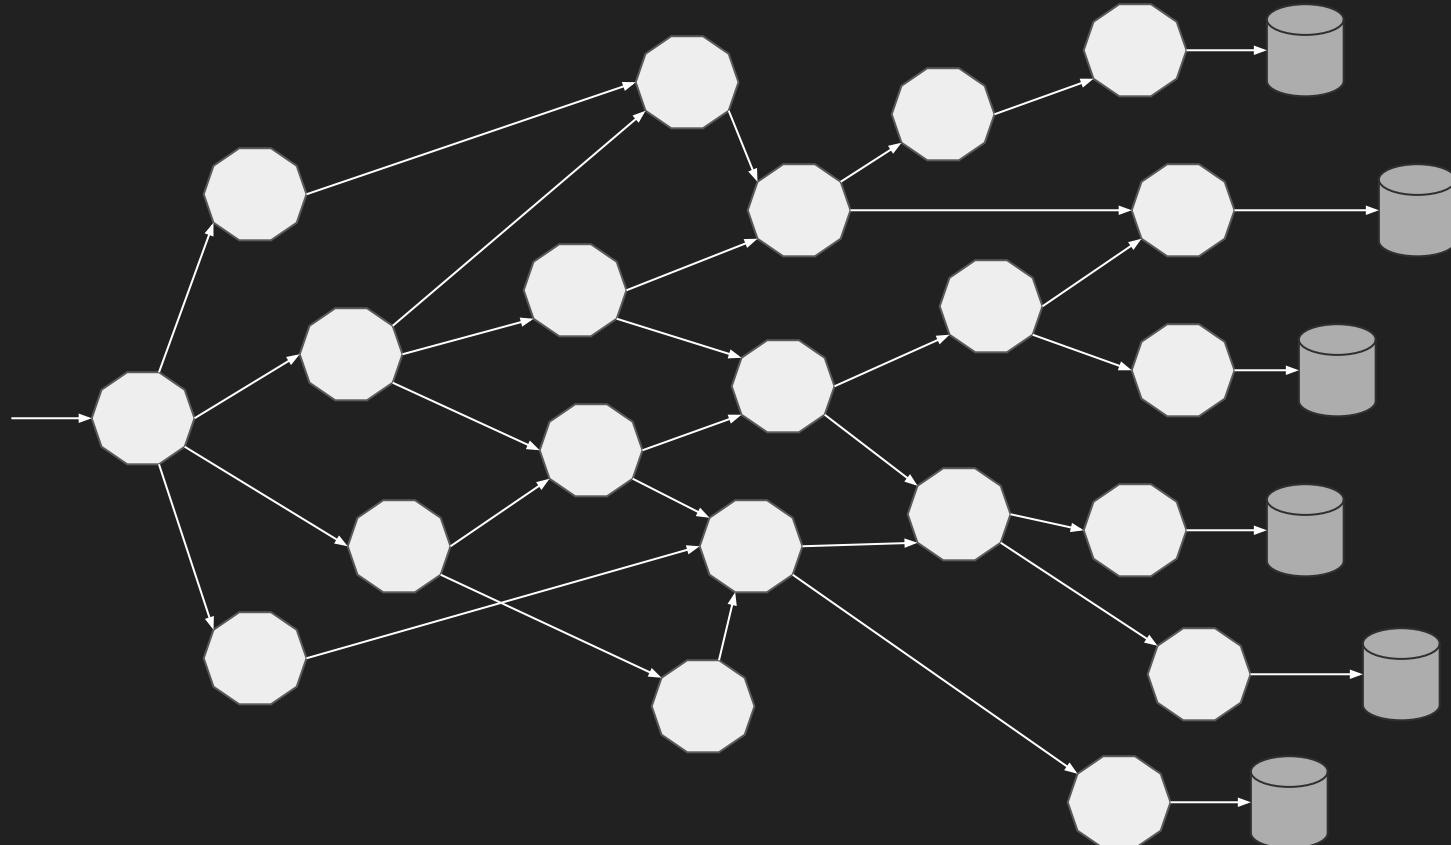

# Microservices

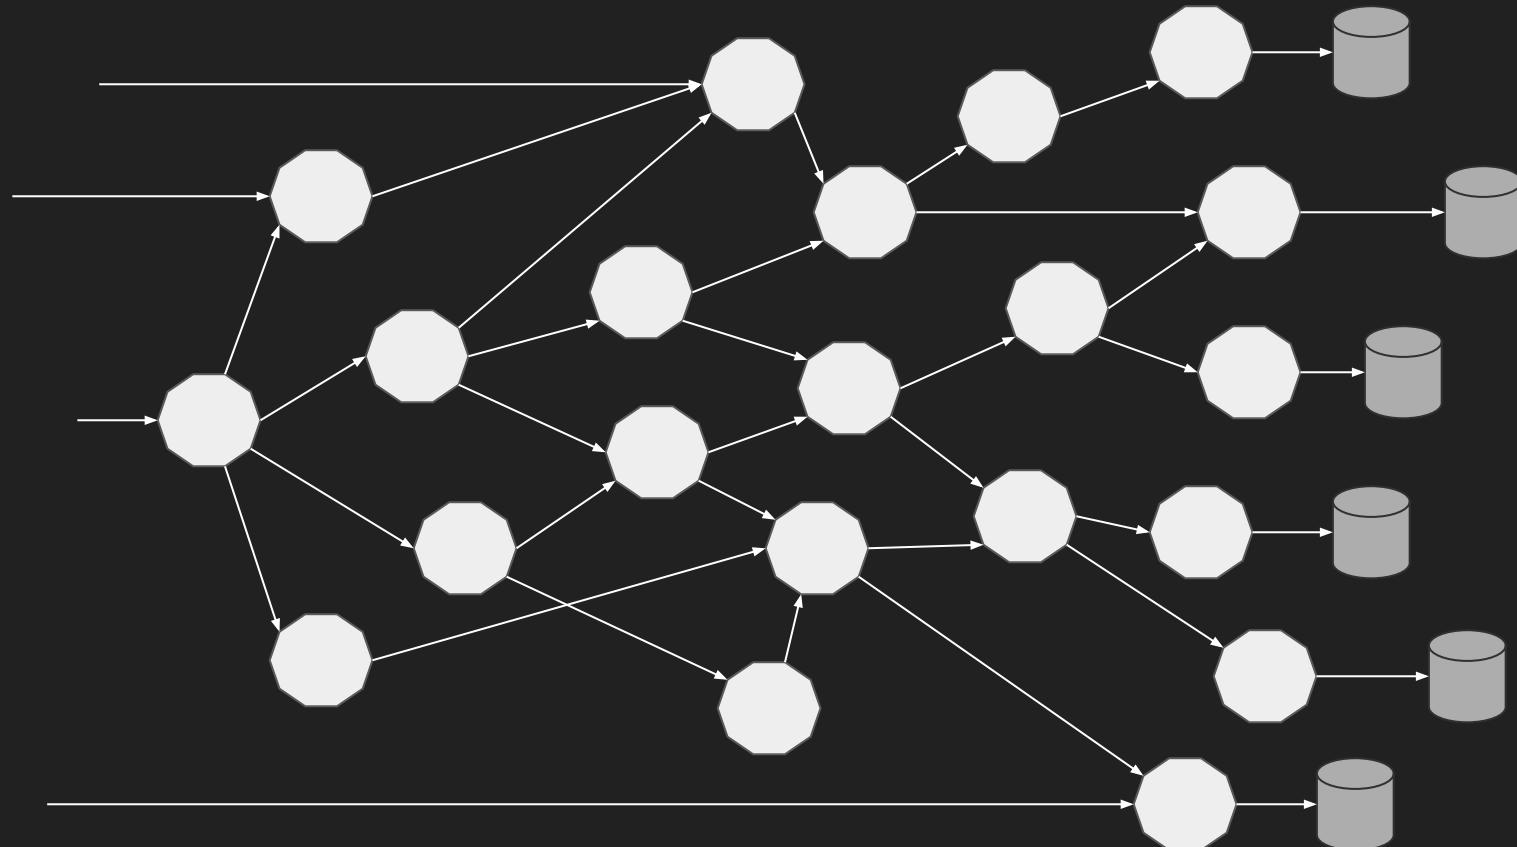

# Network of Services

# Microservices own their Data

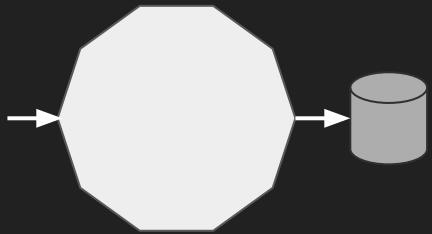

# Multiple Points of Entry

# Microservices Principles

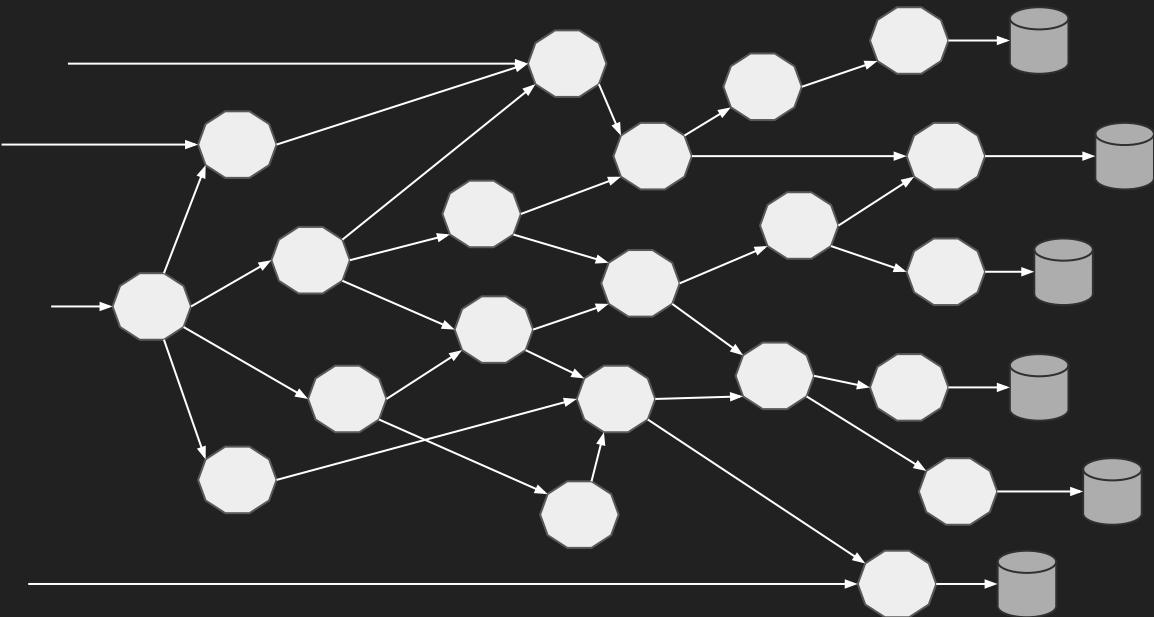

1. Deployment **Independence** - updates to an individual microservice have no negative impact to any other component of the system. Optimized for **Replacement**
2. Organized around **business** capabilities
3. **Products** not Projects
4. API Focused
5. Smart endpoints and dumb pipes
6. Decentralized Governance
7. Decentralized Data Management
8. Infrastructure Automation (infrastructure as code)
9. Design for failure
10. Evolutionary Design

# New School

OPENSHIFT

# Microservices == Distributed Computing

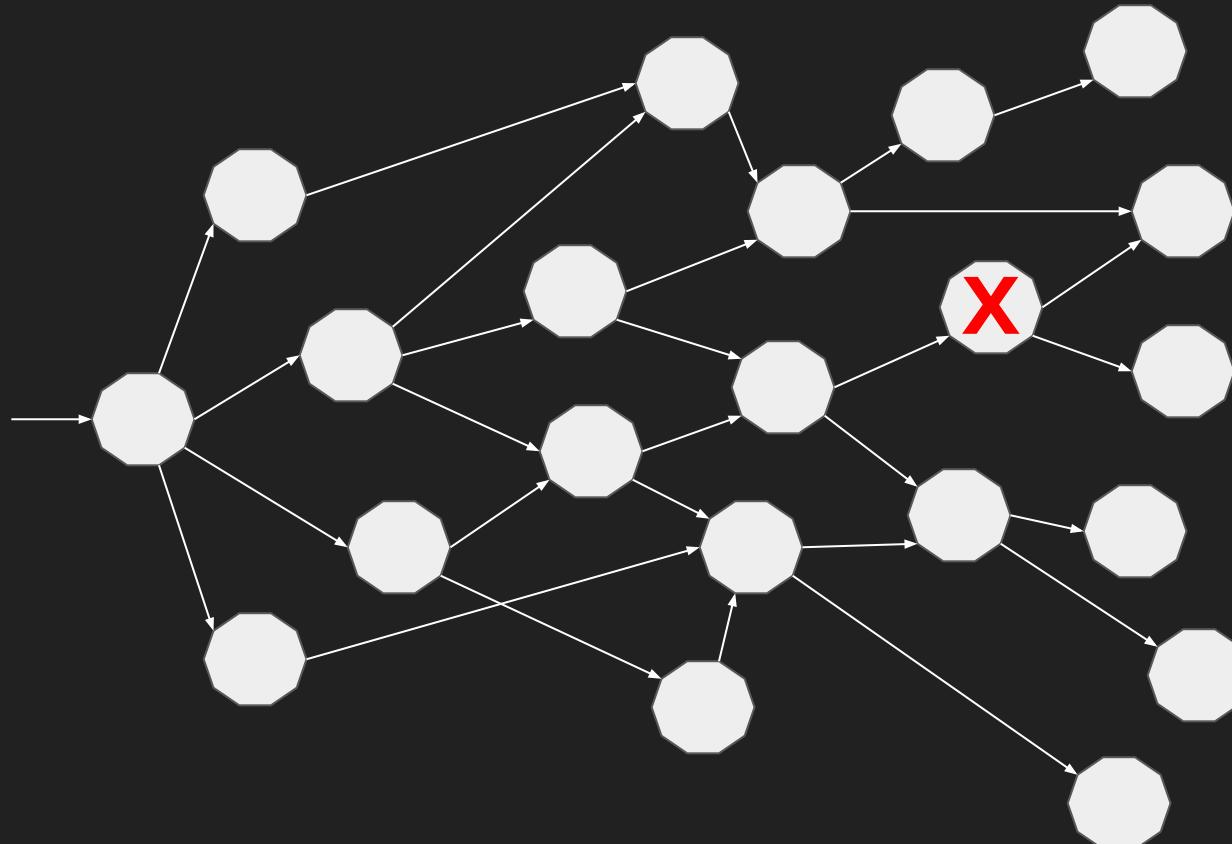

# Fallacies of Distributed Computing

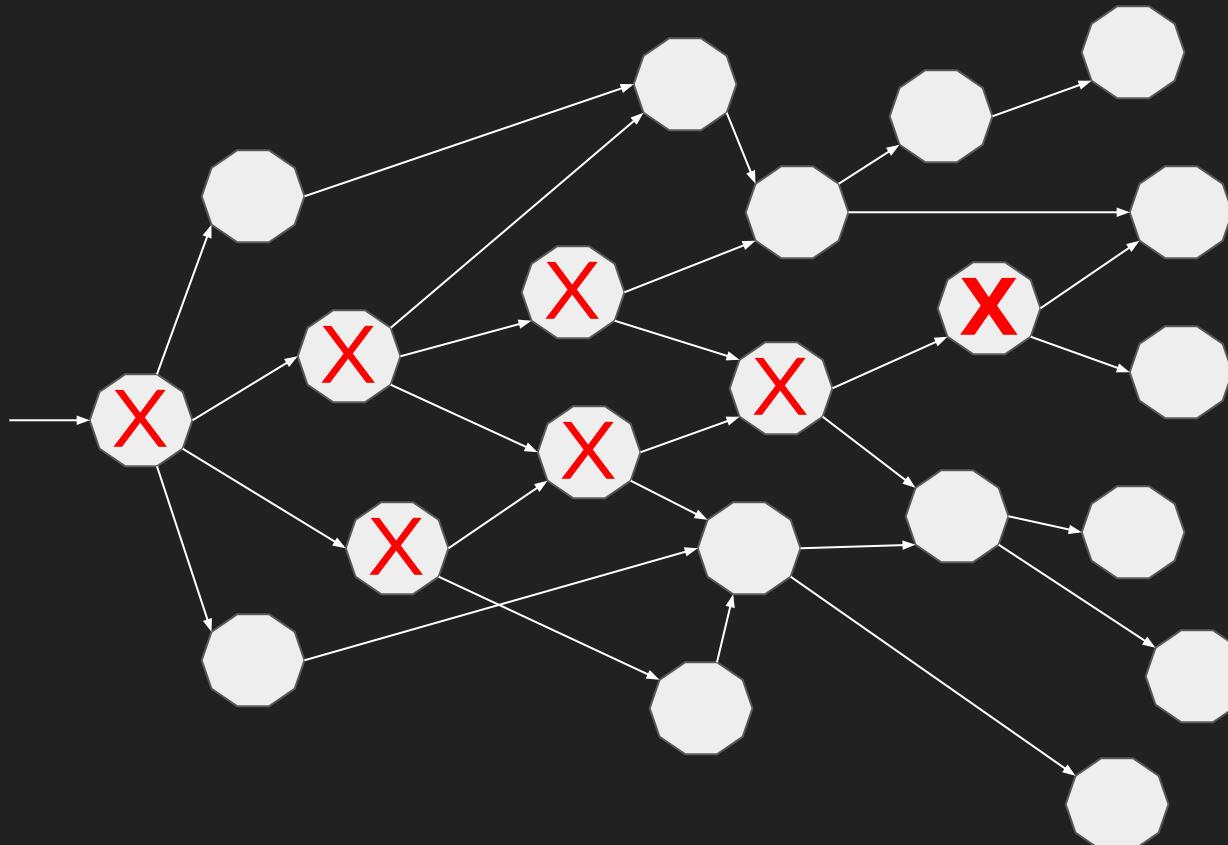

- The Network is Reliable
- Latency is zero
- Bandwidth is infinite
- Topology does not change
- There is one administrator
- Transport cost is zero
- The network is homogeneous

# Service Mesh Defined

A service mesh is a dedicated infrastructure layer for handling service-to-service communication. It's responsible for the reliable delivery of requests through the complex topology of services that comprise a modern, cloud native application. In practice, the service mesh is typically implemented as an array of lightweight network proxies that are deployed alongside application code, without the application needing to be aware

<https://buoyant.io/2017/04/25/whats-a-service-mesh-and-why-do-i-need-one/>

## CustomResourceDefinitions of Istio 1.0.x

kubectl api-resources | grep istio

# Main Istio Resources (API Objects based on CRDs)

- VirtualService
  - defines the rules that control how requests for a service are routed within an Istio service mesh
  - routing logic, load weighting, chaos injection
- DestinationRule
  - configures the set of policies to be applied to a request after VirtualService routing has occurred
  - load-balancer, outlier, circuit breaker
- ServiceEntry - egress enablement
- Gateway - making a service external to cluster - Ingres
- Policy - enable mTLS
- ServiceRole - roles for RBAC
- ServiceRoleBinding - "users" for the ServiceRole

The screenshot shows the Keycloak Admin UI interface. The left sidebar is dark-themed with white icons and text, showing navigation options like 'Master', 'Add realm', 'Realm Settings', 'Clients', 'Client Scopes', 'Roles', 'Identity Providers', 'User Federation', 'Authentication', 'Manage', 'Groups', and 'Users'. The main content area has a light background and displays the 'Master' realm settings. The 'General' tab is selected, showing fields for 'Name' (set to 'master'), 'Display name' (set to 'Keycloak'), 'HTML Display name' (containing a snippet of HTML: '<div class="kc-logo-text"><span>Keycloak</span></div>'), 'Enabled' (set to 'ON'), 'User-Managed Access' (set to 'OFF'), and an 'Endpoints' section with a link to 'OpenID Endpoint Configuration'. At the bottom are 'Save' and 'Cancel' buttons.

# 1.0 Changes

- RouteRule -> VirtualService
- DestinationPolicy -> DestinationRule
- EgressRule -> ServiceEntry
- Ingress -> Gateway
